Fish Dataset

This fish dataset currently consisting of 3,960 images collected from 468 species. This data consists of real-world images of fish captured in conditions defined as "controlled", "out-of-the-water" and "in-situ". The "controlled" images consist of fish specimens, with their fins spread, taken against a constant background with controlled illumination. The "in-situ" images are underwater images of fish in their natural habitat and so there is no control over background or illumination. The "out-of-the-water" images consist of fish specimens, taken out of the water with a varying background and limited control over the illumination conditions. A tight red bounding box is annotated around the fish.

Dataset

This data are used for WACV 2014 paper "Local Inter-Session Variability Modelling for Object Classification". Baseline classification results can also be found in this paper.
